

The Movemental AI Path

Source-of-truth extension

Part nine: the Movemental technological foundation

Part ten: consolidated pricing across the path

A Movemental field paper extension · May 2026

This document extends the prior source-of-truth document. It picks up where Part Eight ended — at the cross-stage productization summary — and adds two parts that the prior document acknowledged but did not fully develop. Part Nine documents the Movemental technological foundation: the architecture that makes Solutions deployment possible, what is built and operating, what is built and adjacent, and what would be built per engagement. Part Ten consolidates pricing across all four stages and all configurations into a single reference, including the platform-tenant and network-platform configurations the prior Solutions section described in summary form.

Part Nine deepens the Solutions framing of Part Seven. It does not replace Part Seven; it documents the technological substrate that gives Configurations B through F their credibility. Part Ten replaces the scattered pricing references throughout Parts Three, Five, Six, Seven, and Eight with a single consolidated reference table that names every offering, every level, and every segment.

Stage 04 (continued): Solutions

Part nine: the Movemental technological foundation

Solutions Deployment as described in Part Seven assumes a technological foundation that the prior document referenced but did not document. This part documents that foundation honestly. It names what Movemental has built, what is operating, what is adjacent, and where engagement-specific work begins. It does so because the credibility of the Solutions configurations — particularly Configurations D, E, and F at the network-platform end of the spectrum — depends on the technological foundation being real and being readable.

Nine-A: What was built, and what that means

Movemental was incorporated and began operating in late 2025. The technological foundation was built primarily by a single architect over approximately seven months, on top of agentic development

infrastructure that compresses the work-hours-to-output ratio significantly relative to conventional engineering. The result is a multi-tenant content and intelligence platform with a typed entity chain, an agent inventory, a credibility scoring layer, a course scaffolding system, a deterministic content ingest pipeline, and an audit document that catalogs what is in the canonical repository versus what lives in sibling repositories versus what remains aspirational.

The honest framing is this. The architecture is industrial in its discipline. Most companies of comparable scope arrive at this kind of architecture after eighteen to twenty-four months of team engineering. Movemental arrived at it solo in seven months because of the agentic development infrastructure. Some pieces are fully implemented in the canonical repository; some are documented and live in sibling repositories under active development; some are architectural plans not yet built. The audit document maintained internally distinguishes among these categories rigorously and is updated with each repository survey. This rigor matters because a clear-eyed view of what is built today is the basis for what can be deployed tomorrow.

What follows describes the foundation at five layers: the data and content pipeline, the typed entity chain, the multi-tenant model, the agent inventory and governance integration, and the operational integrations including CRM and voice intake.

Nine-B: The content and data pipeline

The content pipeline is, in our judgment, Movemental's most distinctive technical asset. Most AI-for-organizations companies are wrappers around a model provider. Movemental holds a substrate that converts organizational content from heterogeneous source forms into structured, queryable, AI-grounded data. The substrate compounds: each piece of content added becomes part of an organization's active intelligence layer rather than a static archive.

The pipeline accepts:

- Books and long-form manuscripts (PDF or other source) converted to structured markup, stored as relational rows with chapter-level granularity, with pricing and commerce identifiers integrated where applicable.
- Articles in markdown with YAML frontmatter, deterministically validated and migrated as conventions evolve, ingested into content tables via scripts rather than model-based upload.
- Course content authored as markdown week-files that serve as single-source-of-truth slices, scaffolded into structured course/module/lesson rows with cohort and drip-schedule support.
- Video and audio inputs extracted and transcribed (FFmpeg, Whisper-class transcription), structured into searchable text grounded in courses and archive search.

- Translation and batch NLP for multilingual deployments, particularly relevant for Spanish-language and Portuguese-language network engagements where Movemental's warm network is positioned to serve.

What this means commercially: when an organization deploys with Movemental, their existing content — sermons, program documentation, donor communications, curriculum, faculty writing, podcast archives, training materials — becomes the substrate the AI operates on. The recipes (Claude skills) the organization uses are grounded in their content, their voice, their tradition. The credibility scoring, the SEO work, the formation companion — all draw from the organization's own material. This is what allows Movemental's deployments to land in the organization's actual voice rather than producing the generic AI output that everyone has learned to recognize.

Nine-C: The typed entity chain

The architecture is structured as a six-layer chain that runs from database to user interface, with five of the six layers generated and validated automatically and the sixth (the user interface) hand-built from design specifications. The discipline this enforces is that backend changes propagate predictably, schemas and services stay in sync, and the user interface remains under deliberate design control rather than being mechanically generated from data shapes.

The chain runs as follows. The PostgreSQL database schema is defined in Drizzle ORM as the system of record. From the schema, a Zod validation layer is generated. From Zod, a service layer is generated using a result-pattern that handles success and failure cases consistently. From the services, REST API routes are generated. From the routes, TanStack Query hooks are generated. The user interface is built by hand using semantic Tailwind tokens locked to a pinned design source, ensuring that the visual surface remains a deliberate craft layer rather than a mechanical projection of the schema.

The practical commercial implication: when Movemental builds a deployment for an organization, schema changes specific to their work propagate automatically through the validation, service, route, and hook layers. The hand-built user interface is the only surface that requires deliberate engineering attention per organization. This is what allows custom deployments to ship in weeks rather than months — the substrate is generated; the surface is composed from a designed component library that is itself accelerated by a Stitch-to-React workflow that locks visual design as a single source of truth.

Nine-D: The multi-tenant model

The architecture was built multi-tenant from inception rather than retrofitted. This is significant because retrofitting multi-tenancy into a single-tenant codebase is one of the most painful migrations in software, and the difficulty of it is the reason most platform offerings in adjacent sectors are built single-tenant and then re-architected at substantial cost when the platform business model becomes the right business model.

The model is built on Supabase Postgres with row-level security and an organization-id-based isolation pattern. Every relevant table carries an organization scope. The organizations table itself includes plan, subdomain, custom domain, and settings configuration. A tenant-organization-id pattern allows single-tenant deployments to use the same codebase as multi-tenant network deployments — meaning that the Configuration A tool optimization, the Configuration D platform tenant, and the Configuration E multi-node network all run on the same architectural foundation, with the network deployment being the multi-tenant case the architecture was designed for from day one.

What this means for Configuration E specifically: when an institution engages Movemental for a network deployment, each member organization receives its own tenant with its own data, its own configuration, its own user base, and its own user interface customization, while sharing the institutional governance framework, the cross-tenant content pipeline where authorized, and the SEO and discoverability propagation across the network. The platform was built for this case. The pricing for Configuration E reflects that an institution buying it is not buying engineering hours; it is buying a structural capacity for network-scale intelligence that compounds across the member organizations.

Nine-E: Agent inventory and governance integration

Movemental maintains an inventory of approximately twenty-two named AI agents documented with explicit behavior boundaries. The agents fall into five functional themes: search and discovery (SEO scoring, keyword research, schema generation, related content semantic discovery); credibility and voice (voice-and-vocation coaching, voice authenticity, credibility scoring against organizational rubrics, theological integrity review, writing assistance with human-in-the-loop control); writing and structure (content structure, article companion, sermon shaping with multi-sub-agent orchestration, translation, agent orchestration); learning and formation (formation companion for learners, formation coach for staff developers, course companion for in-course assistance, missional-DNA assessment, assessment interpretation); and research and lab (AI Lab agent with corpus-grounded vector store and themed instructions, archive explorer, contextual book reading help).

The agents operate against governance constraints documented at the system level: human publish required for any externally-facing content, theological integrity review for content touching tradition or doctrine, no silent strategy execution without authorization, credibility scoring against organization-specific rubrics, and a system of explicit behavior boundaries that names what each agent will and will not do.

What this means in deployment: when a Solutions configuration is delivered, the agents that operate within it carry the organization's Safety documentation as constraints. The Acceptable Use Policy informs what the agents are permitted to do. The Data Handling Standards constrain what data the agents can touch. The Care Boundaries shape what work the agents are structurally prevented from entering. The Disclosure and Attribution Standard governs what the agents annotate as AI-assisted. The

governance is not adjacent to the deployment; it is wired into it. This is the practical instantiation of the thesis that AI built on a coherent foundation compounds rather than corroding.

Nine-F: CRM and voice intake

Movemental has solved the constituent-relationship-management layer through a combination of established CRM stack components and a cutting-edge capability that warrants specific naming: a voice-based intake system that automatically sorts relational intelligence as it captures conversations.

The CRM stack covers the standard work of a constituent relationship system: pipeline for prospects, learners, donors; lifecycle email sequences with deliverability handling; segmentation; integration with existing organizational systems where the organization already operates a CRM (Planning Center for churches, Bloomerang or Salesforce Nonprofit Cloud for nonprofits, denominational membership systems for institutions). For organizations without an existing CRM, Movemental can deploy the CRM as part of the platform tenant; for organizations with an existing CRM, Movemental integrates rather than replacing.

The voice-based intake capability is the more distinctive part. The system captures voice conversations — discovery calls, member onboarding, donor stewardship, pastoral intake — and automatically extracts and structures the relational intelligence those conversations contain. Names, relationships, history, areas of interest, prayer requests where appropriate, donor capacity signals where appropriate, follow-up commitments, and the texture of the conversation itself become structured records that route to the right people in the organization with the right context. The capability addresses a real pain point — the relational intelligence inside ministry and nonprofit conversations is constantly lost because no one has time to take notes — and it does so in a way that preserves the human warmth of the conversation rather than imposing a clipboard between the conversational partners.

What this means commercially: Configurations D and E include CRM and voice intake as integrated capabilities rather than as components the organization must source separately and integrate themselves. This significantly compresses the time-to-value for the deployment and removes one of the most common failure modes in AI deployments at adjacent vendors — the gap between the AI capability and the relationship-management substrate it must operate within.

Nine-G: Honest accounting

The audit document Movemental maintains internally tracks what is fully implemented in the canonical repository, what is documented and operating in sibling repositories under active development, and what is architectural plan not yet built. Some examples of how this distinction matters in conversation with prospective customers and investors:

- Markdown ingestion to content tables, course markdown scaffolding, the typed entity chain, the multi-tenant organization model, the Stitch-to-React design workflow, the studio component package, the agent inventory documentation, the Safety governance integration pattern, and the Sentry-Resend-Supabase-Vercel operational stack are operating in the canonical repository.
- The full agent runtime, the Liveblocks collaborative editing layer, the context engine for packet assembly, the Stripe and Shopify SDK integration, and the dashboard surfaces are documented and operating in sibling repositories that this organizational site does not directly contain. Verification requires the sibling repository for runtime confirmation in any specific deployment.
- CRM live integration is documented as solved at the architectural level with the stack components named. Specific deployment requires customer-environment configuration. The voice intake capability is real and demonstrable.

We name this rigor because it matters. Most companies overclaim their architecture and underdeliver their deployments. Movemental's practice is to maintain a distinction between what is built, what is adjacent, and what is planned, and to be honest about each in conversation. This protects buyers from disappointment and protects Movemental from engagements scoped against capabilities that did not actually exist when the contract was signed. The audit document is the artifact that enforces this discipline; it is updated with each repository survey.

Nine-H: The Solutions configurations, refined

Part Seven of the prior document described five Solutions configurations. Given the technological foundation documented in this part, the configuration set is refined to six configurations that better describe the actual offering spectrum, with explicit acknowledgment that the architecture supports the network-platform configuration as a credible offering rather than as an aspirational claim.

Configuration A — Tool Optimization. Claude Enterprise or comparable enterprise-tier AI tool, configured with custom skills, prompts, and Safety integration against the organization's Acceptable Use Policy and Data Handling Standards. Documentation, staff training, and 90-day operational support included. Suitable for organizations whose Sandbox surfaced strong use cases that do not require new infrastructure. Most organizations should consider this configuration first.

Configuration B — Composed Application. A focused web application built on Movemental's typed-entity stack for one or two specific workflows, integrated with the organization's existing systems via API. The application is deployed to the organization's infrastructure or hosted by Movemental as preferred. Suitable for organizations with specific high-value workflows that exceed what tool optimization can deliver but do not require a full platform.

Configuration C — Content and Intelligence Platform. The organization's archive — sermon library, program documentation, curriculum, faculty writing, podcast archive — converted into a queryable, AI-grounded, workflow-integrated platform. Configuration C is particularly relevant for institutions with substantial accumulated content that is currently static and underutilized. Includes the content pipeline, agent layer for archive interaction, and integration into the organization's existing communication and learning surfaces.

Configuration D — Movemental Platform Tenant. The organization receives a dedicated tenant of the full Movemental architecture: typed entity chain, multi-tenant organization model, agent inventory, learning management, content pipeline, studio components, CRM integration with voice intake, and Safety governance integration. The tenant is configured for the organization's specific work, branded to the organization's identity, and operated under the organization's governance. This is the integrated-platform configuration that the architecture was designed to support, made available as a service.

Configuration E — Network Platform with Multi-Node Deployment. For institutions, denominational bodies, training networks, and multi-site organizations, Configuration D is extended into a network deployment. The institution receives the platform tenant, and additionally receives the capacity to deploy sub-tenants for connected nodes within their network — member churches, special ministries within the institution, partnered organizations, leader platforms within the network. Each sub-tenant is its own configured platform; all sub-tenants share the institutional governance framework and the cross-node content and discoverability propagation. The institution becomes a platform for its own network, with the network compounding through SEO, discoverability, and shared intelligence in ways no single-organization deployment could achieve. This is the architectural innovation Movemental is structurally positioned to offer.

Configuration F — Hybrid and Bespoke. Combinations of the prior configurations and custom requirements scoped per conversation. Includes engagements where Configuration A is appropriate for some workflows while Configuration C or D is appropriate for others, where international or multilingual deployment requires specific architecture, or where the organization's existing technical environment requires bespoke integration work.

***A candid note.** Most organizations should buy at the lower end of this spectrum, not the higher end. Configuration A serves more organizations well than Configurations D and E combined. The 2026 nonprofit data showed 92% of nonprofits using AI with only 7% reporting major capability improvement; the bottleneck is rarely the technology, and Movemental will not pretend otherwise. An organization that completes the Safety,*

Sandbox, and Skills work and then deploys Configuration A with care will get more value than an organization that buys Configuration E without the upstream work. Configurations D and E are correct for institutions and organizations whose Sandbox surfaced platform-scale opportunity and whose Skills capacity is sufficient to operate platform-scale capability. They are not for everyone, and we will say so before, during, and after a sales conversation.

Nine-I: The network multiplication thesis

Configuration E deserves explicit framing because it is the configuration where Movemental's architecture delivers value that no alternative offering in the sector currently delivers.

The thesis is this. A denominational network with fifty member churches, each running its own AI tools independently, produces fifty parallel AI deployments that do not compound. Each church reinvents prompts. Each church builds its own recipes. Each church surfaces independently in search. The denomination, despite holding the relational and theological coherence of fifty congregations, gets no platform value from that coherence at the AI layer. The same is true for a training network with its institutes, a seminary with its partner programs, a multi-site church with its campuses, a nonprofit network with its chapters.

When the same network deploys Configuration E, the institution holds the platform; the member organizations operate as sub-tenants with their own configured slice of it; the institutional governance framework propagates across the network; content produced by any node becomes discoverable across the network where authorized; SEO and content optimization compound rather than competing; agent capability matures across the network as the network learns. The network self-perpetuates as a platform-scale intelligence rather than as fifty independent deployments.

This is the structural innovation Movemental is positioned to offer. It is not a feature; it is the architectural premise the platform was built on. Configurations D and E are priced accordingly because the value an institution receives is not engineering hours but the platform-scale advantage their network gains. An institution that deploys Configuration E for fifty member organizations is buying something that no off-the-shelf tool can deliver and that no consulting firm can build in a reasonable timeline starting from scratch. It is buying multi-tenant platform value that exists because the architecture was designed for it from inception.

Nine-J: What deployment actually requires from the organization

The technological foundation does work, but it does not eliminate the work the organization must do. A clean-eyed view of what each Solutions configuration requires from the organization itself:

- **Configuration A.** The organization needs Safety documentation, named green-light use cases from Sandbox, staff capacity to operate the configured tools (Skills or equivalent), and a designated

leader who owns the deployment after the 90-day operational support window. Time commitment from the organization: roughly 20-40 hours of staff time during the deployment phase.

- **Configuration B.** All of the above plus a clear specification of the workflows to be deployed and access to the systems the application will integrate with. Time commitment: 60-100 hours of staff time during build and deployment.
- **Configuration C.** All of the above plus a content inventory commitment — the organization must work with Movemental to identify, locate, and prepare the content that will be ingested. The content preparation work is often the gating item in the timeline. Time commitment: 100-200 hours, with the bulk of it in content preparation.
- **Configuration D.** All of the above plus an executive sponsor with sustained leadership attention through the build phase, plus integration access to the organization's existing CRM and communication systems, plus a designated operations leader who will own the platform after deployment. Time commitment: 200-400 hours over the deployment period.
- **Configuration E.** All of the above at the institutional level, plus participating commitment from member organizations within the network, plus a network-level governance body that holds the institutional framework. Configuration E is not a platform purchase; it is a network-formation engagement. Time commitment varies dramatically with network size: typically 400-1000 hours at the institutional level plus 50-150 hours per member organization.

The honest framing is that Configurations D and E require institutional-level commitment to deploy well. They are not engagements an organization can run in the margins. They become possible when the organization has decided that platform-scale AI capability is part of their next chapter and is willing to invest the leadership attention deployment requires.

Part ten: consolidated pricing across the path

This part consolidates pricing across all four stages, all productization levels, and all segments into a single reference. The pricing replaces the scattered pricing references throughout the prior parts of the document. When pricing is updated — based on engagement learning, market positioning, or scope refinement — the update happens here first; downstream marketing, sales, and contractual references regenerate from this source.

Pricing is presented in three sections. First, a master reference table covering every offering at every level. Second, segment-specific pricing notes that name where churches, nonprofits, and institutions encounter different price points or different configuration emphasis. Third, the bundling and

progression pricing — the discounts that apply when an organization commits to multi-stage engagement.

Ten-A: Master pricing reference

The following table covers every Movemental offering at every productization level. Prices are in U.S. dollars and reflect first-engagement pricing as of May 2026. Renewal pricing for ongoing platform subscriptions and annual licenses is named separately where applicable.

Stage 01: Safety Documentation

Offering	What is delivered	Price	Segments
Field Guide (Free Toolkit)	Downloadable seven-item toolkit with boilerplate, decision worksheets, sector-specific data category templates, and reference card. Email gate; no support.	Free	All
AI-Assisted Safety Product	Structured intake plus AI generation of customized seven-item safety documentation. Async Q&A support during ratification. Quarterly-updated tools reference.	\$1,997	All
Facilitated MVP Engagement	Two-week facilitator-led engagement producing all seven artifacts ratified by leadership. Includes leadership working sessions, board ratification support, and custom voice tuning for the constituent letter.	\$5,000	All
Safety + Care Boundaries Add-on	Optional add-on for AI-Assisted Safety Product: 30-minute facilitator consultation specifically for the Care Boundaries item, where AI assistance most needs human review.	\$300	All

Stage 02: Sandbox Discovery

Offering	What is delivered	Price	Segments
Self-Service Sandbox Toolkit	Downloadable assessment artifact, starter recipe library, Use Case Portfolio template, Discernment Memo template, Readiness Assessment template, four-week internal facilitator guide, and 60-minute orientation call.	\$497	All
AI-Assisted Sandbox	Configured Claude skills tuned to segment and Safety documentation, pre-customized assessment artifact, Use Case Portfolio web interface, asynchronous facilitator support across four weeks (2-3 hours per week).	\$3,997	All
Facilitated Sandbox Discovery	Movemental facilitator runs full four-week engagement: assessment, recipe configuration, weekly working sessions, collaborative adjudication, Discernment Memo, Readiness Assessment, leadership conversation.	\$15,000	All
Network Sandbox (Institutions)	Sandbox engagement extended to institution plus 3-10 member organizations, with shared discovery, shared portfolio, and a teaching artifact published to the network at conclusion.	From \$60,000	Institutions only

Stage 03: Skills Development

Offering	What is delivered	Price	Segments
----------	-------------------	-------	----------

Self-Paced License	Annual license: full eight-module course delivered self-paced, agentic tutoring throughout, up to 25 participants per organization, quarterly virtual cohort moments across the network of licensed organizations, annual content updates.	\$4,800/year	All
Cohort Facilitation	Movemental facilitator runs eight-week cohort for 8-15 participants from a single organization (or multi-org cohorts at institutional level). Weekly synchronous sessions, asynchronous discussion, exercise review, closing integration conversation.	\$15,000	All
Network Skills	Skills delivered as part of network engagement: institutional cohort plus 3-10 member-organization cohorts, with shared resources, cross-cohort moments, institution-level integration.	From \$60,000	Institutions only
Train-the-Facilitator Certification	Twelve-week certification program for institutions that want to deliver Skills internally. Certified facilitators can run the course under license with annual recertification.	\$25,000	Institutions; large orgs

Stage 04: Solutions Deployment

Offering	What is delivered	Price	Segments
Scoping Consultation	2-3 week scoping engagement producing a Solutions Brief without committing to build. Brief	\$5,000	All

	is portable; pricing credited toward build engagement if customer returns within 90 days.		
Configuration A — Tool Optimization	Enterprise AI tool configured with custom skills, prompts, and Safety integration. Documentation, staff training, 90-day operational support.	\$30,000-\$50,000	All
Configuration B — Composed Application	Focused custom web application for one or two workflows, built on Movemental stack, integrated with existing systems. 90-day operational support.	\$80,000-\$150,000	All
Configuration C — Content & Intelligence Platform	Archive-active platform with content pipeline, agent layer, workflow integration. Plus annual platform licensing.	\$80,000-\$150,000	Content-heavy orgs
Configuration D — Movemental Platform Tenant	Full platform tenant: typed entity chain, agent inventory, LMS, content pipeline, studio components, CRM with voice intake, governance integration. Plus annual platform licensing.	\$180,000-\$320,000	All
Configuration E — Network Platform	Configuration D plus multi-node sub-tenant capacity for member organizations. Cross-node content and discoverability propagation. Tiered annual licensing per node.	\$350,000-\$650,000+	Institutions; networks
Configuration F — Hybrid/Bespoke	Combinations and custom requirements. Scoped per conversation.	Scoped	All

Annual platform licensing (post-deployment, where applicable)

Configuration	Annual platform license	What is included	Segments
Configuration C	\$15,000-\$30,000/yr	Platform hosting, content pipeline maintenance, agent updates, quarterly capability review.	Content-heavy orgs
Configuration D	\$24,000-\$48,000/yr	Full platform hosting, all updates, CRM and voice intake operations, quarterly review, priority support.	All
Configuration E (institutional)	\$36,000-\$72,000/yr	Institutional platform hosting, network governance services, cross-node propagation, quarterly review.	Institutions only
Configuration E (per node)	\$6,000-\$12,000/yr per node	Sub-tenant hosting, configuration maintenance, node-level support.	Member orgs in network

Ongoing engagement after deployment

Engagement type	What is included	Price	Notes
Annual retainer (org-hosted)	Periodic optimization, agent updates, governance review, on-call advisory. For deployments where the organization hosts.	\$10,000-\$30,000/yr	Configurations A, B
Quarterly review (any config)	Quarterly working session: deployment review, governance update, capability planning.	Included with annual licensing	C, D, E
As-needed engagement	Hourly or project-based work post-deployment for organizations that have transitioned to self-operation.	\$300/hour or scoped	All
Add-on Skills cohorts (post-deployment)	Additional Skills cohorts to expand internal capacity beyond initial	Standard Skills pricing	All

	deployment team.		
--	------------------	--	--

Ten-B: Segment-specific pricing notes

The master pricing reference applies across segments, but each segment has texture that affects which offerings are most relevant and where configurations land within their pricing ranges.

Churches

Most churches engage at the Safety and Sandbox levels first. The Field Guide and Facilitated Safety MVP serve solo pastors and smaller congregations well; the AI-Assisted Safety Product serves mid-size churches with a small staff. Sandbox engagement at the facilitated level is appropriate for churches with budget for substantive discovery; the AI-Assisted Sandbox serves churches that want strong support without full facilitation. Skills cohort facilitation is well-positioned for multi-staff churches whose staff will benefit from formation as a group. Configuration A is the most common Solutions deployment for churches; Configurations C and D become relevant for large churches with substantial sermon archives or multi-site operations. Configuration E is the configuration for denominational bodies, networks of churches, and church-planting organizations engaging at the network level.

Nonprofits

Nonprofits often arrive with stronger AI adoption than they have governance for, which makes the Safety stage particularly valuable as a corrective rather than as foundational work. The AI-Assisted Safety Product serves the typical mid-size nonprofit well; the Facilitated MVP serves nonprofits where the board needs the structured engagement to ratify governance with confidence. Sandbox at the facilitated level is high-value for nonprofits with operational complexity — multi-program organizations, advocacy groups, social-service nonprofits with beneficiary-facing programs. Skills serves nonprofit teams whose work spans development, programs, and operations. Configurations B and C are the most common Solutions deployments for nonprofits, with Configuration B serving focused workflow needs (donor stewardship, grant writing) and Configuration C serving organizations with substantial program documentation. Configuration D becomes relevant for large nonprofits with platform-scale operational complexity.

Institutions: seminaries, training networks, denominational bodies

Institutions typically engage at the network level from the start, which positions them toward Network Sandbox, Network Skills, Train-the-Facilitator certification, and Configuration E from the Solutions menu. The institutional engagement model means Movemental is engaged not only by the institution but by the institution's member or partner organizations through the same framework. Pricing for institutions reflects the network-scale value: Configuration E in particular is priced to reflect that the institution is

buying network platform value that compounds across member organizations rather than buying engineering hours for a single deployment. Train-the-Facilitator certification is highly relevant for institutions that want Skills capacity to live inside their walls and propagate through their formation programs over time.

Ten-C: Bundling and full-path pricing

Movemental does not require organizations to commit to the full path at intake; most engagements begin at one stage and continue based on what emerges. However, organizations that commit to multi-stage engagement at the time of first contract receive bundled pricing that reflects the engagement efficiency of working with a single partner across the path.

Two-stage bundles

Bundle	Components	Bundled price	Discount
Safety + Sandbox	Facilitated Safety MVP + Facilitated Sandbox Discovery	\$18,000	~10% off (\$20,000 separately)
Sandbox + Skills	Facilitated Sandbox Discovery + Cohort Skills Facilitation	\$27,000	~10% off (\$30,000 separately)
Skills + Solutions A	Cohort Skills Facilitation + Configuration A Solutions Deployment	From \$40,000	~10% off (varies)

Full-path bundles

Bundle	Components	Bundled price	Notes
Full Path (Configuration A)	Safety MVP + Sandbox Discovery + Skills Cohort + Configuration A Solutions	\$58,500	10% off \$65,000 separately
Full Path (Configuration B/C)	Safety MVP + Sandbox Discovery + Skills Cohort + Configuration B or C Solutions	From \$108,000	10% off (varies by Solutions config)
Full Path (Configuration D)	Safety MVP + Sandbox Discovery + Skills Cohort + Configuration D Solutions	From \$200,000	10% off (varies)
Network Path	Network Sandbox +	From \$440,000	10% off institutional

(Configuration E)	Network Skills + Configuration E Network Platform		engagement (varies by network size)
-------------------	---	--	--

What the bundling discount reflects

The bundle discount is not a margin sacrifice; it reflects engagement efficiency. When Movemental knows from contract signing that an organization will move through multiple stages, the team configures the engagement for continuity: the facilitator who runs Safety transitions to Sandbox; the recipe library configured during Sandbox feeds Skills directly; the Skills cohort produces the staff who will operate the Solutions deployment. The 10% discount captures the margin Movemental gains from this continuity and shares it with the customer who committed to the full path.

Organizations that choose to engage stage-by-stage are not penalized; they pay standard pricing per stage. The choice between stage-by-stage and bundled is a customer choice based on their certainty about the path. Movemental does not pressure organizations into bundles before they are ready.

Ten-D: Pricing posture

A note on the pricing posture overall, because it informs how the team should hold pricing in conversation with customers and prospects.

Movemental's pricing reflects three convictions. First, that the work is real and the value is real, and pricing should reflect that rather than reflecting the discount-anxiety patterns that consulting and SaaS pricing often falls into. The Safety MVP is not priced at \$5,000 because that's what the market will bear; it's priced at \$5,000 because two weeks of facilitator time on an outcome that protects the organization is honestly worth that and is honestly worth more, and the lower-priced AI-Assisted product exists for organizations whose budget cannot reach \$5,000.

Second, that segment-specific pricing is reductive of the work and Movemental will not do it. A church and a nonprofit and an institution doing the same work receive the same price for the same work. Discounts exist for full-path commitment, for network-scale engagement, and for context where Movemental and the organization mutually agree that the work warrants it. Discounts do not exist by category of organization.

Third, that pricing is honest about what Movemental does and does not provide. Configuration A does not pretend to be Configuration D. Configuration E does not pretend to be available to every organization. The pricing structure is transparent so that the conversation between Movemental and a prospective customer can focus on what the organization actually needs rather than on what the salesperson is trying to sell.

The path is the path. The pricing reflects the path. This document keeps both coherent.

Update protocol for Parts Nine and Ten

Parts Nine and Ten are subject to the same update protocol as the rest of the source-of-truth document. The technological foundation evolves as Movemental's repository evolves; the pricing evolves as engagement learning informs the team. Updates happen in this document first; downstream marketing, sales, and contractual references regenerate from this source. Quarterly review by the Movemental team. Annual review of pricing against engagement margin and market position. The audit document referenced in Part Nine is updated with each repository survey.

The path is the path. This document keeps the path coherent.
